

IronChain

OHMGYM BY IRON CHAIN · SOLANA MOBILE BUILDER GRANT · APPLICATION · SEPTEMBER 2026

PROOF OF TRAINING, SIGNED BY THE FRIEND WHO WATCHED.

Iron Chain turns a workout into a proof on Solana. The user owns it. **No speculative token.**

\$48,250

four milestones, paid on delivery

21 weeks

to a co-signed duel on Seeker

Seeker first

MWA, Seed Vault, dApp Store

Dahu Wake Family Sàrl · Geneva, Switzerland · ironchain.studiodahu.ch · [@ironchain_app](https://twitter.com/ironchain_app) · github.com/ironchain-app/ironchain-protocol

WHERE WE COME FROM

"WHAT MAKES A BOX ISN'T THE EQUIPMENT. IT'S THE PEOPLE."

We trained in a box in France, then moved away — and so did our friends. What we missed was never the equipment: the energy of people training beside you, a coach whose advice landed, a WOD scaled to the level you were actually at. No recorded programme can put two people in a session together.

So Joris built the app we could not find: **one that lets you train apart without training alone**. The session is scaled to you, on the gear you own, and a friend is on the other phone. That is why we wrote the live 1v1 ourselves — and went head to head with friends in other countries. **A leaderboard does not make you finish the set; the mate who pushes you and gives you grief does.**

Then came the part we had not planned for. That mate had watched you do it — and nobody had a way to prove it.

WHAT WE WANTED BACK

The energy of your friends, a coach whose advice lands, and a **WOD scaled to the level you are at** — in a garage, with one kettlebell.

WHAT WE BUILT, UNFUNDED

ohmGym. 240 commits since late August, 1,100 tests, live 1v1 video training.

WHAT THIS APPLICATION FUNDS

Iron Chain on Seeker. Your mate countersigns with a fingerprint in the Seed Vault — we know no other Solana app that does it. The proof is yours: a tournament, a gym or an insurer can read it without going through us.

THE PROBLEM

OTHER APPS PAID PEOPLE TO MOVE, TOOK THEIR WORD, **AND KEPT THEIR HISTORY**

THEY PAID PEOPLE TO MOVE

StepN and Genopets paid a token per step. When the money stopped, the people stopped. The ones still standing now live on insurers and corporate programmes, paid in ordinary currency.

Left with: **a dead token**

THEY TAKE YOUR WORD

Strava records what you declare, for 195 million registered athletes. A public link lets anyone look at a session. Nothing lets them verify it.

Left with: **a screenshot**

THEY KEEP YOUR HISTORY

Ten years of sessions belong to the company that stored them. Change app, and the record does not come with you. There is nothing to export that anyone else would accept.

Left with: **nothing at all**

The fix is not a better reward. It is a record the user owns, that someone else can check.

Networks built on physical work do not win by handing out tokens. They win when someone needs that work verified, and pays to read it.

WHAT IRON CHAIN IS

A TRAINING APP THAT WRITES **PROOF YOU OWN TO SOLANA**

You train alone, or head to head with a friend, one phone each. When the clock stops, you both sign. The proof lands in your wallet, not in our database.

If we shut down tomorrow, you keep it. A stranger can verify it with a link.

The protocol underneath is open under Apache 2.0. Any app can issue and verify the same proofs.

Design target - the shipped screens are in the demo video

A human watching you train is the hardest witness to fool. The peer co-signs the proof.

SIX SIGNALS, NOT A SCORE

CODE	SIGNAL	WHAT IT ESTABLISHES	COST TO FAKE
D	Declared · the user logs the session	Nothing. It is the starting point.	None
B	Bracketed · two in-app photos, hashed on the device	Something happened between t_0 and t_1	Low to medium
M	Measured · heart rate, calories, steps over the session	A body was under load	Medium
C	Coherent · the heart-rate curve matches the declared effort	The effort matches the claim	High
W	Witnessed · a peer co-signs, present over live video	A human saw the session	Very high
N	Notarized · a verified coach co-signs	A professional stakes their reputation	Highest

"signals": ["D", "B", "M", "C", "W"] · A proof carries the signals it actually has. Nothing more. The reader applies its own threshold.

EVERYONE ELSE STOPS AT D

Every fitness-on-chain project we know writes a self-declared session and calls it proof. We record D as what it is: a claim. Then we add the rest.

WHY SIGNALS, NOT A SCORE

A "level 3" ages badly. The day one signal is faked, every past attestation collapses with it. Signals don't: stop trusting B, and M, C, W stay readable on proofs issued years ago.

W is the signal Iron Chain is built around. A watch can go on someone else's wrist. A person watching you cannot. We know no other Solana app that puts a human witness in front of a session.

BUILT ON OUR OWN FUNDS. **THIS GRANT** FUNDS THE SOLANA PART.

COMPONENT	STATUS	PLATFORM
Workout engine, nutrition, social feed, live 1v1 video over WebRTC, health sensors	BUILT, WORKING	ohmGym by Iron Chain · iOS, TestFlight
Android edition: signed release APK, full workout flow on a physical device	BUILT · SEPT 17	Android
Mobile Wallet Adapter 2.0 : Phantom and Solflare connect on a physical device	BUILT · SEPT 17 · DEVNET	Android
First session proof on-chain, as a signed memo through the MWA wallet	ON DEVNET · SEPT 14	Android
<code>ironchain-protocol</code> , the open standard, Apache 2.0	PUBLISHED · SEPT 15	
SAS credential and <code>ironchain-month</code> schema deployed, addresses public, cost measured on a bench	BUILT · SEPT 24 · DEVNET	Solana
Silent wallet, fees paid by the user or the premium plan, the app writing attestations on that deployed schema , Seed Vault	THIS GRANT · M1	Android · Seeker
Proof capture: photo hashing on device, Play Integrity, offline queue	THIS GRANT · M2	Android
Public launch: safety tooling, dApp Store listing, two quests	THIS GRANT · M3	dApp Store · Seeker
Co-signed duel in the Seed Vault on mainnet, Health Connect signals, duel notifications	THIS GRANT · M4	Seeker

The first public release is the Solana dApp Store.

A WORKOUT IS THE REAL WORLD. IT TAKES A CAMERA, SENSORS, AND A FRIEND ON THE OTHER PHONE.

LIVE 1V1 VIDEO **W · WITNESSED**

Two friends train together over WebRTC. It works today. A watch can go on someone else's wrist. A person watching you train cannot be faked. The peer co-signs.

WEARABLE SENSORS **M · MEASURED** **C · COHERENT**

Health Connect reads calories, steps, resting heart rate and HRV. A claim becomes a measurement.

CAMERA CAPTURE IN THE APP **B · BRACKETED**

A photo at the start and at the end of the session, hashed on the device. Only the hash leaves the phone.

Together, these signals constrain each other. To fake a session you would need a heart rate curve between two photos taken in the app. You would have to train.

Design target · the shipped screens are in the demo video

WHERE EACH PIECE OF THE STACK STANDS TODAY

PIECE	STATUS	WHAT IT DOES FOR THE USER
Mobile Wallet Adapter 2.0	BUILT · SEPT 17	Phantom and Solflare connect on a physical Android device, on devnet. Video linked in the application.
Seed Vault	MILESTONE 1	Hardware signing on Seeker. A countersignature costs a fingerprint.
Who pays the fees	MILESTONE 1	The user pays from their Seeker wallet, or the premium plan covers it through a relay. The user sees a badge.
dApp Store	MILESTONE 3	Our launch platform. The signing key was generated on September 14.
Quests	MILESTONE 3	Our product is a badge system. Two quests at launch.

THE METRICS WE REPORT

dApp Store installs.

Attested sessions.

Duels co-signed by a live human witness, one phone each. We know no other Solana app that produces this number.

Instrumented from the first line of the integration.

ONLY ON SOLANA MOBILE

WHY SOLANA, AND WHY THE SEEKER

SOLANA ATTESTATION SERVICE

The attestation standard of this ecosystem, a public good under Apache 2.0. Our schemas extend it.

SEED VAULT

Hardware signing on the phone is a Solana Mobile primitive. A countersignature that costs a fingerprint exists only here.

OWNERSHIP THAT SURVIVES US

The attestation lives in the user's wallet. If Iron Chain shuts down, the proof remains and stays verifiable.

MOBILE WALLET ADAPTER

The Solana Mobile standard for connecting a wallet on Android. Phantom and Solflare connect on a physical device, built since September 17.

Together, these four make a countersigned session portable — a proof the user carries to whoever needs to read it: **an insurer applying its own policy to attested activity**, a gym, a race organiser, reading a session without having to trust us for it. None of that works if the proof lives in our database.

We built ohmGym on iOS first. **The live 1v1 changed the plan:** a session witnessed in real time needs a chain that can carry the proof and a phone that can sign it. So **Solana Mobile gets this app first — before any app store**, and the ecosystem is where it can go further than we could alone.

Only a hash goes on-chain. Health data and photos stay on the phone. Swiss company, Swiss and EU data protection law.

\$48,250 ACROSS **FOUR MILESTONES**, EACH PAID ON DELIVERY

M1 · A PROOF THE USER OWNS 6 WK · \$10,000

A user finishes a session. A proof they own is written to Solana through a wallet that runs itself.

Accepted when: a signed APK creates the wallet at signup, fees come from the user's wallet or the premium plan, the attestation shows as a badge with a public verification link, and the Seed Vault signs on Seeker.

M2 · PROOF CAPTURE 6 WK · \$13,700

The record becomes hard to forge: photos hashed on device, gallery imports rejected, Play Integrity, offline queue, badges.

Accepted when: attestations with integrity checks are on mainnet, on the published schema, verifiable with the open verifier. **Target reported:** 1,000 attestations on mainnet.

M3 · PUBLIC LAUNCH 4 WK · \$14,550

Safety tooling required by the Publisher Policy: reporting, blocking, moderation, age gate. Store listing and review. Two quests.

Accepted when: Iron Chain is live on the dApp Store with two quests. **Targets reported:** 500 installs and 300 co-signed duels on Seeker within 60 days.

M4 · CO-SIGNED DUEL ON SEEKER 5 WK · \$10,000

Both players sign the duel result in the Seed Vault. Health Connect signals are attached. Duel invitations arrive as push notifications.

Accepted when: a duel between two Seekers yields one attestation on mainnet, co-signed by both, verifiable with the open verifier. **Target reported:** co-signed duels on mainnet in 60 days.

A stranger can verify every milestone: an APK to download, a query on the explorer, a store listing. The schema and the verifier are protocol work, funded separately. Out of scope: any marketplace or payment flow.

THE CO-SIGNED DUEL, SIGNED IN THE SEED VAULT

Milestone 3 counts duels co-signed in the app. Milestone 4 puts that countersignature on-chain and anchors it in hardware.

Both players sign the result in the Seed Vault. A fingerprint each. One attestation carries both signatures, on the `duel-result` schema, on mainnet.

Health Connect adds calories, steps, resting heart rate and HRV. A claim becomes a measurement.

A duel starts from the lock screen, through a push notification. On screen, the countersignature reads “Certify Matt’s session”: one tap, one fingerprint.

A human witness and a hardware signature on each side. A reason for two people to own a Seeker.

Design target · the shipped screens are in the demo video

ACCEPTED WHEN

A duel between two Seekers produces one attestation on mainnet, co-signed by both through the Seed Vault, verifiable with the open verifier. Health Connect signals appear on devices that expose them.

5 weeks · \$10,000 · 15 working days · two Seekers from Milestone 1

74 WORKING DAYS OVER 21 WEEKS, LINE BY LINE

MILESTONE 1	DAYS	\$
Lead dev: silent wallet, fee relay, first SAS attestation, Seed Vault	12	8,400
Dev: profile badge, public verification link	3	1,200
Second Android test device, needed for 1v1		400
Two Seeker devices before Milestone 1 starts		—
Milestone 1	15	10,000
MILESTONE 2		
Lead dev: photo hashing on device, Play Integrity, offline queue, mainnet attestations	16	11,200
Dev: badges, proof screen, reference verifier	5	2,000
Rent and fees for the pilot's 1,000 mainnet attestations, covered by this grant line		500
Milestone 2	21	13,700

MILESTONE 3	DAYS	\$
Lead dev: reporting, blocking, moderation, age gate, quests	14	9,800
Dev: store listing, screenshots, review and fixes	6	2,400
Strategy and ops: moderation policy, report handling, metrics	3	2,100
Store visuals in the required formats		250
Milestone 3	23	14,550
MILESTONE 4		
Lead dev: duel results on the duel-result schema, Seed Vault countersignature, Health Connect	11	7,700
Dev: duel result screen, notifications, co-signed badge	4	1,600
Rent and fees for the pilot's duel attestations on mainnet, covered by this grant line		700
Milestone 4	15	10,000
Total requested	74	48,250

Per working day: lead developer, founder, \$700. Developer, contracted or in house, \$400. Strategy and ops, founder, \$700. The lead developer carries 53 of the 74 days, about one working day in two over 21 weeks. What we absorb sits elsewhere — \$112,000 of founder time absorbed, none of it funded. Seekers and launch support are asked for on slide 14.

WE CARRY MORE THAN THE PROGRAMME DOES

FOUNDER TIME, UNFUNDED	WORKING DAYS	\$
Design and first code of Iron Chain, June to August 2026. Lead developer, \$700 a day.	25	17,500
Preparation sprint, September 3 to 13. Three founders, \$2,100 a day.	7	14,700
Colosseum hackathon, September 14 to October 12, then tester pilot and judging to November 2. Three founders, \$2,100 a day. Shipped: signed Android release, MWA on hardware, protocol repo, schema on devnet.	36	75,600
Economic design calibration, self-funded: pricing, mint rule and cost per proof tested against the tester cohort. Economics designer at the market rate, \$600 a day.	7	4,200
Founder contribution in kind, 161 founder days	75	112,000

2.3×

founder time against the amount requested, before any grant funding is received.

The last line is seven days of economic design calibration, paid by us. We test the price, the mint rule and the real cost per proof against the tester cohort, and we report what comes out.

The founders built the product before a single line of blockchain code: workout engine, nutrition, social feed, live 1v1 video. **We ask you to fund bringing a product that works to Solana and putting it on your store.**

One funder per layer. This budget covers the Android application and its launch.

THREE PEOPLE, ONE SHIPPED PRODUCT, ONE ECOSYSTEM GRANT DELIVERED

The hard problem is human. Our head of product comes from anthropology and social work.

JORIS BRUCHET

CTO and lead developer · Geneva · managing director · github.com/Superjojo74

Built the product: 240 commits since late August, 1,100 tests, live 1v1 WebRTC, a signed Android release, MWA on hardware. Native iOS bridges written in house.

20 years of production software. **Flutter apps live on the App Store and Google Play**, the latest in 2025.

Set up and ran an Ethereum validator node for his own company for three years. Solana and Ethereum.

Nine years of critical systems at the International AIDS Society, four World AIDS Conferences, 23,000 attendees. That is why we treat health data the way we do.

MÉLIBÉE BRUCHET

Head of strategy, product and operations · Geneva

Master's in Humanitarian Action, University of Geneva, and in Anthropology; state-qualified social educator. Five years in social work before product. Why people keep training, or stop, is her field.

Co-founded and ran Dahu Wake Park for seven years: a watersports and accommodation business. Real customers, partnerships, operations.

Full product lifecycle on web and mobile at Studio Dahu since 2022: framing, user journeys, delivery.

Runs the tester pilot, the grant applications, and the moderation and community-safety policy for the dApp Store launch, Milestone 3.

LÉO DELION

Web3 product and economy · France · github.com/leo2lion

Won and delivered a Web3 ecosystem grant: TrustNomiks, backed by Intuition Protocol. 337 commits, deployed.

Cofounder of Nomiks, about €1M pre seed with Outlier Ventures. Economic modelling for Chiliz, The Sandbox, FDJ, Stacks.

Owns the open protocol: schemas, TypeScript SDK, integration docs. No speculative token.

Should the protocol ever need an ecosystem token, it would be decided after the product exists, issued under EU and Swiss rules, and never distributed as a reward for training.

WHAT EXISTS TODAY, AND WHAT STARTS NOW

The app, **ohmGym by Iron Chain**, runs on iOS TestFlight, internal. Iron Chain is the open standard underneath it. The first public release is the dApp Store.

The Android edition is signed with a dedicated dApp Store key and runs end to end on a Xiaomi, Android 16, since September 17.

MWA connects Phantom and Solflare on hardware. A finished session is written on devnet as a signed memo since September 14. Public protocol repository since September 15.

We are entering **CLOCK IN**, the Solana Mobile hackathon, with the same APK, demo and deck, on October 8.

How it spreads. A duel takes two, so every player brings a partner. Every proof comes with a public link anyone can check: the Strava screenshot, made verifiable. Sharing your progression comes next.

The pilot is under way, self funded: ten testers who train in pairs for two weeks. We will publish the first results in early October, whether they are good or bad: sessions completed per tester, duels played, and who stopped and why.

BEYOND FUNDING, WHAT WE ASK FOR

Two Seeker devices before Milestone 1 starts. Seed Vault signing is an acceptance criterion of Milestone 1 and exists only on Seeker. The 1v1 duel is tested two by two. If they arrive late, we buy them and the milestone stays on schedule.

A place in a dApp Store quest season and in Spotlight at launch, Milestone 3. Our two quests are built on what the product already is: a badge system.

Co marketing on Solana Mobile channels at launch. We give the 200,000 Seekers shipped a reason to train. The store brings them to us.

WHAT THE ECOSYSTEM KEEPS IF IRON CHAIN DISAPPEARS

We publish an open standard for verifiable physical activity under Apache 2.0: the proof-of-activity schema family on the Solana Attestation Service, plus TypeScript and Flutter SDKs. Public since September 15 at github.com/ironchain-app/ironchain-protocol.

The standard records **which independent signals corroborate a claim**: declared, bracketed, measured, coherent, witnessed, notarised. The reader applies its own threshold. A standard that hardcodes a level dies the day that level is defeated. One that records signals stays useful.

WHO CAN USE IT WITHOUT US

A fitness app whose users keep their history when they switch.

A gym that verifies attendance while member data stays private.

An insurer that applies its own policy to attested activity.

A race organiser or a tournament that co-signs results.

Any Solana app that needs proof a human did something physical.

WHAT WE NEED TO KNOW FROM YOU

1. Does the programme fund work already underway, or only work that starts after the grant agreement is signed? We are self funding a development sprint now and want to structure the milestones correctly.
2. We sized this request at \$48,250 across four milestones, each paid on delivery. If the programme prefers to start smaller, we can split it. Milestones 1 to 3 put the app on the dApp Store for \$38,250. Milestone 1 alone is a \$10,000 deliverable.
3. How are grant funds released, in what form, and on what schedule after a milestone is accepted?
4. Seed Vault signing is part of Milestone 1 and exists only on Seeker. Our core feature is a live 1v1 duel, tested two by two. Can the programme provide two Seekers before Milestone 1 starts? Otherwise we buy them, and we would like to know early.

For reviewers, on request, within 24 hours: read access to the app repository, the signed Android APK, and a TestFlight build of ohmGym, our iOS base app. And a live 1v1 with us: the witness signal, experienced rather than read.
